AIOps Day 1

Mystery Challenge Diagnosis

Diagnosis status	**Correct**
Actual fault	**CPU**
Recorded timestamp	1793072890

1. Changed signal

CPU usage

2. Log evidence

The logs showed successful /work requests with HTTP status 200

3. Diagnosis

I believe the problem is excessive CPU consumption because CPU usage increased while the error ratio remained at 0% and P95 latency stayed around 95 milliseconds.

4. SLO and error-budget impact

This does not burn the availability/error budget because the error ratio is 0%. It may affect the latency budget only if the SLO threshold is below 95 milliseconds.

5. Interpretation

The CPU fault increased resource consumption without immediately causing request failures. Successful HTTP 200 responses showed that the application was still serving users. The 0% error ratio indicated that the availability error budget was not being consumed during the observed period. The latency result must be compared with the defined latency SLO to determine whether a latency budget was affected.

6. Verification

Field	Recorded value
Challenge answer	CPU usage
Challenge ground truth	cpu
Integrity hash	`60c02ddb63f2c2172a8319c90f203b9b1492b78848ed403a53432d53e54f7bfb`
